LET'S TALK ABOUT ACADEMIC DISHONESTY

[AI] is **inevitably** going to be part of the future.
SOPHOMORE

I'm hoping that if they are caught, then they **won't do it again**.
TEACHER

Too many people at our school are taking the **easy path**.
FRESHMAN

AI is **such a good guide**… if it's not misused… It's a good tool and **should be used more often**.
SENIOR

I cheat in all my classes.
JUNIOR

I have used AI for assignments, but it **brings me a lot of regret** when I think about it.
SOPHOMORE

Without ChatGPT, I'd **actually be so stupid**.
SOPHOMORE

Everyone cheats, from sharing answers in between tests, whispering the answer, using AI, or even finding worksheets online.
JUNIOR

When somebody else cheats, I feel like they're **giving up**.
FRESHMAN

I use AI every day. I was just using it. Matter of fact, I'm about to do my homework with ChatGPT right now.
SENIOR

My grade got better so that's all that matters.
JUNIOR

People who rely on AI are stupid bums who are **gonna go to college and fail** when the professors don't accept their slop.
JUNIOR

Cheating's always been present, and there've been a number of means or ways to accomplish it.
TEACHER

It's better for us to **teach students how to use AI** in a more intelligent way.
SOPHOMORE

If students… look for a **shortcut** instead of doing hard things, they'll **miss out on the…pride of accomplishment.**
TEACHER

What good is it gonna do them? Because they're **not learning anything** and they're **not doing anything for themselves.**
JUNIOR

I'm really **dependent on AI** right now.
SOPHOMORE

I do my work... what other people do with their work is **not my problem**.
JUNIOR

I love ChatGPT. It's like the **robot I always dreamed of** having to do my homework for me when I was little is actually real.
SENIOR

Writing is **a way of showing thinking**; if you're having a machine do the thinking for you, it is **really problematic** in the long run.
TEACHER

A lot of people use AI, and **not all of it is for malicious things**. Some people use it to **help them study**, or for concepts they don't understand.
SENIOR

I have been able to **save so much time** now, which I really need with college applications, by using AI on my assignments.
SENIOR

I do not use AI but if I saw someone using it, **I wouldn't care.**
SENIOR

I **know my teacher uses AI for assignments**, and it's really easy to tell.
JUNIOR

I am **so far away from understanding why you would do it**… when we—teachers—are so accessible.
TEACHER

The existence of AI and its popularity has made teachers mistrust students. Personally, I've had my assignments flagged as AI when they weren't.
JUNIOR

I feel like **I'm just the police** trying to hunt down cheating.
TEACHER

When two people get the same grade but one person actually did the work, **it is demotivating**.
JUNIOR

If… you use AI to fully accomplish the assignment and get full credit… it's honestly a bit **disappointing**.
SENIOR

I think that AI makes it a lot **easier and faster to cheat**… and it's more prevalent now. But I also do think that there's a lot of **AI checkers that… flag innocent people.**
SENIOR

It's **so much more difficult** for me to figure out what my students actually know.
TEACHER

I don't think that many people use AI or cheat in everyday life at AHS.
FRESHMAN

It **gets in the way** of me becoming a better student…and **I hate it**… I don't write anymore because all my teachers have taken [writing assignments] out of my classes because of AI.
SENIOR

When you cheat, you are **doing a disservice to yourself**… it's more important to **learn and grow** than to just get a good grade.
TEACHER

It allows students to do a lot of shortcuts and **save time**… but when it comes to actually making information stick in your own brain, I think it can be **more harmful than helpful**.
TEACHER

You're **losing control** of your brain or how your brain works. You **stop thinking** eventually, and I'm scared of that… **I want to keep thinking. It's nice.**
SENIOR

EDITORIAL

Where is the Line Between Inspiration and Cheating?

At ANDOVERVIEW, we believe academic dishonesty, particularly involving AI, has become a pressing issue within the school community. Students are often scared to ask teachers for help, don't have time to complete the work, or are simply lazy, so they ask AI to do the work for them.

We do not exclude ourselves from this tendency. To our knowledge, ANDOVERVIEW has never allowed AI to change the truths that we report, but we know for certain that there have been drafts put forward by students for publication in the past years that have relied on AI. We acknowledge that the problem with AI usage is schoolwide (in fact, nationwide). Now, as part of the student body, we want to raise awareness and spark conversation.

Cheating causes an uneven playing field between those who use AI or cheat in any way and those who do their work honestly. Academic dishonesty also hinders teachers' ability to understand how much their students truly retain what is being taught.

Today, many teachers seem to have different policies regarding AI use. Some classes allow or even encourage AI for learning purposes or assistance in researching topics. For other classes, it's not so clear. While students should use reasonable judgment to not use AI to replace original work, they must also figure out where unclear rules apply. Academic integrity in one classroom may be considered a violation in another.

While a schoolwide policy exists—which prohibits unoriginal or unattributed work—it provides AI-use considerations for students and teachers, not established guidelines. It is lengthy and simultaneously unclear at times. More specificity is needed to ensure coursework isn't a guessing game for students.

At ANDOVERVIEW, we believe students who use AI—not as a replacement for their own work and effort—need a clear policy for what is considered academic dishonesty.

Importantly, we also need consistency. But until that line is drawn, students must use their best judgment to recognize when an action would be academically dishonest. If so, we urge you to choose a different path. Is it truly worth risking your academic reputation and potentially your future? Academic integrity starts with each individual student.

OPINION COLUMN

Explaining the Special Issue

By Isabella Yan || EXECUTIVE EDITOR

A couple of days ago, I watched a friend of mine run her English essay through multiple AI detectors despite having written it for herself. But it's nothing new—it's something I've observed time and time again, glancing at classmates' laptop screens or listening to friends rant about a school assignment.

These moments solidify for me how artificial intelligence (AI) has transformed education. Emerging besides new technology, AI has created a source of tension, distrust, and disconnect throughout the AHS community.

Since ChatGPT's release in late 2022, a multitude of similar AI tools such as Claude, Gemini, and Deepseek have been made available to students. These user-friendly platforms make it easy to get answers for a biology worksheet without actually having read the questions, or write a history response despite not having read the text it's based on. AI tools have now become deeply embedded in many students' learning, studying, and homework; a recent study by College Board found that 84% of high school students reported using AI to complete schoolwork.

What strikes me most about AI usage is how students and teachers have responded with shared fears and concerns. As we all try to navigate education's changing landscape, teachers review work and students complete work under the same assumption of AI use. The prevalence of such tools has created frustration and skepticism among teachers, while also causing worry and fear among students about AI accusations, whether rightly or falsely.

This special issue, *Let's Talk About Academic Dishonesty*, is dedicated to illuminating the different perspectives, challenges, and experiences of students and teachers with an AI-impacted education. AI will have an enduring presence within education, and a clear knowledge gap in education exists between the rapidly developing technology and schools' ability to effectively counteract its implications. So, with no easy solution, the best thing we can do is to create mutual understanding. In this issue, our purpose is not to establish a single stance, but to close the rift: recognizing how students and teachers alike have been navigating this transition within education.

"Study Tracks AI Dependence, Cognitive Decline" by Areeta Faiz and Arshiaa Prem [page 3] discusses the psychological detriments of AI usage, drawing on an MIT study and input from scholar Dan Levy, sources that reveal lower brain activity and obstructed learning in AI users. The article shares input from Spanish teacher Adriana Gonzalez, who touches on AI's obstruction of the learning process, as well as the development of self-esteem issues when students compare their work with AI. The results of AI's negative impact on learning appear evident, as MCAS scores remain below pre-pandemic levels.

"Academic Pressure Drives AHS Students to AI" by Advika Singh and Kaveri Dole [page 3] speaks of a narrative of student AI use that is rarely addressed in academic settings. It describes the many pressures placed on high school students—whether academic, extracurricular, or personal—and how they push students to quicken workloads with the use of AI. While acknowledging genuine academic dishonesty, Singh and Dole also encourage readers to recognize issues in our education system and their role in student AI usage.

"AI, Wikipedia Share Problem" by Samin Faiz and Avery Slaughter [page 3] explores the increasing convenience of AI and how this has caused students to use it often when doing online tasks. Now automatically available on most search engines and devices, AI answers have become difficult to avoid. Faiz and Slaughter describe how AI's abundance encourages student use. It introduces the view that student use of AI is not always incentivized by a desire to cheat, but rather by AI's inescapable profusion.

"Did you use AI?: AI Affecting Student-Teacher Relationship" by Christina Saad [page 4] delves into how AI use in the classroom has caused friction between teachers and students, especially when teachers confront students for AI use. Teachers at AHS share their experience of difficult confrontational conversations, and students share their experience of changing their writing in hopes of not being falsely accused of usage. Saad provides a gilmpse into the changing policies and methods of assessment at AHS in response to AI use.

"Hey! What About The Teachers?: The benefits and drawbacks of AI in the classroom" by Kendall Murphy, Duru Tanriverdi, and Samantha Sun [page 4], discusses the influence of teachers' use of AI for educational material. The article touches on negative aspects like weakening student-teacher bonds, and positive aspects such as quicker productivity with creating assignments that are suitable to different learners. Murphy, Tanriverdi, and Sun provide a perspective on how AI tools can be beneficial in the classroom when used responsibly by teachers.

In the midst of rampant academic dishonesty, we want to highlight the importance of being considerate of the experiences of teachers and students alike, as well as remind students to maintain academic integrity: for your yourself, your classmates, and your teachers.

Study Tracks AI Dependence, Cognitive Decline

By Areeta Faiz & Arshiaa Prem || STAFF WRITERS

The widespread use of Artificial Intelligence (AI) in the classroom has sparked major concern over its effects on the brain. The current lack of extensive research has left students and staff alike wondering—how much does using AI really impact the learning process, and how does this manifest here at Andover High School?

The seeds were sown with the release of OpenAI's ChatGPT in November of 2022, and its effects become more apparent every day. Across classrooms, teachers are noticing a subtle but unsettling shift: students seem to be completing more work, and faster. The concern, however, is that they are thinking less. As artificial intelligence tools like ChatGPT and Gemini become increasingly widespread, students, educators, and researchers alike are questioning whether this convenience is coming at a psychological cost.

Senior Daksh Sharma spoke towards his apprehension: "It's concerning to see kids our age and young people using AI to keep going forward in their studies, as they are effectively learning nothing," he said, citing a paper written by graduate students and scientists at MIT in June of 2025.

This small study, titled "Your Brain on ChatGPT: Accumulation of Cognitive Debt when Using an AI Assistant for Essay Writing Task," examined 54 test subjects from ages 18-39. They were split up into three groups, each subject tasked with writing an SAT-style essay. One subject group was allowed to access search engines, another group was allowed access to a Large Language Model (LLM) similar to ChatGPT, and the final group was not allowed any sort of assistance.

The participants were connected to EEG monitors to measure brain activity. Strikingly, those who relied on AI showed the lowest levels of executive control and attentional engagement, while the "brain-only" group demonstrated the highest. Over repeated trials, many AI users became increasingly passive and eventually allowed the tool to do nearly all the work, a habit easy for students to fall into.

"You stop thinking eventually, and I'm scared of that," Sharma said. "I don't want to stop thinking—I want to keep thinking. It's nice."

Spanish teacher Adriana Gonzalez also brought up the matter of self-esteem. A student could write their own response to an assignment, for example, and check their work with AI. It then becomes very easy to fall into the trap of comparison, "to say, 'Oh wow, it's better than me, so why bother,'" she said.

Similar sentiments are echoed across classrooms, across the state, and around the world. English teacher Eric Pellerin, who has over 20 years of experience at AHS, spoke about his experiences with students and AI misuse.

"Last year [was] when we first started seeing students using it improperly," he explained. He suggested that AI, phone culture, and social media work together to shorten attention spans and lessen independent thinking.

Academic Pressure Drives Students to Cheat

By Advika Singh & Kaveri Dole || STAFF WRITERS

Many students in Andover High School's competitive environment balance demanding courses alongside extracurricular activities and personal responsibilities, which can become challenging, leading students to seek out Artificial Intelligence (AI).

Freshman Bhavika Sharma defines stress as the main reason students turn to AI shortcuts. "Most people just get very stressed and pressured because they have so much work," Sharma said. For students with overlapping deadlines and long nights of homework, AI can appear to offer relief by helping them complete their tasks. This can refer to streamlining certain tedious tasks, or direct plagiarism, something teachers are becoming increasingly wary of.

Guidance counselor Kimberly Bergey also noticed the impact of rigorous schedules on students. "A lot of students feel like there aren't enough hours in the day," Bergey said. At a competitive school like AHS, pressure in school can be abundant. The average AP score at AHS is a 3.66, with the national average being a 3.06. These heightened expectations often fall on the shoulders of students who strive for academic achievement.

"I think cheating prevents you from retaining information, and it can negatively affect you in the future," said Latin teacher Laura Jordan. AI use can include using it to write entire essays or assignments and submitting it as your own, using it to answer test questions in real time, having AI summaries replace the original text, and building off of AI research without fact checking.

Although many factors can affect a students' decision to use AI, ultimately the choice is the student's, which unfortunately often results in abuse.

On the other hand, AI isn't always sought out as a shortcut, but rather from curious students using it as a resource instead of as a means of plagiarism. "I will occasionally get AI to create practice problems for me resulting in me scoring better in tests," said junior Selina Amere. Other responsible AI use include getting explanations of difficult topics, asking for hints or feedback rather than full answers, summarizing notes you have already written, and AI text to speech or speech to text tools.

As the use of technology in everyday life has become prevalent, AI tools have become more accessible, and their presence in schools has sparked many conflicts. As more students begin to use AI, the need for clear guidelines, especially in an academic setting, becomes more obvious.

Patrick Benjamin, a sophomore at AHS, noticed the impact of these unclear AI guidelines. "The AI rules for each class are different," he said, reflecting how the fine line between misuse and assistance can feel unclear, leading to inconsistent usage across classrooms.

AI, Wikipedia Share Problem

By Samin Faiz & Avery Slaughter || STAFF WRITERS

Recent developments in the artificial intelligence (AI) industry have taken our generation by storm.

With AI-generated responses taking over Google searches and a pocket-sized AI assistant just one click away for many, it's not unreasonable to say that our robotic friends are becoming increasingly integrated into our daily lives. This is no surprise, considering the attractive list of benefits it brings to students.

"It's helpful at times for quick answers," explained senior Vignesha Jayakumar. "You don't need to go to a site and get bombarded with ads and all that cookie nonsense."

Despite its brevity and user-friendliness, AI is notorious for its shortcomings. According to a 2025 study from Columbia University—as well as the past experiences of many—the majority of leading AI engines give answers that are either partially or completely incorrect. The fabrication of information is a phenomenon known as "hallucination," and it's a trap that many students fall into while researching.

"It's very inaccurate at times. Sometimes, AI just spouts out hallucinations when they feel like they're expected to give an answer," Jayakumar noted.

The unreliability of AI seems oddly familiar to certain AHS faculty. Having taught courses that place an emphasis on research, history teacher Ruth Masters shares her experience with a well-known source that presents a similar threat to students.

"It's a place to start, kind of like when I'm teaching research and students ask, 'Can I use Wikipedia?' I'll say, 'No, but you can go to the bottom of an entry and use those sources.' I think of it in the same vein as that."

Jayakumar sees the parallels between AI and Wikipedia, as well. "Every teacher has their own guidelines for research," he added. "But Wikipedia is a one-stop shop for information; Wikipedia is unreliable, AI is unreliable, so maybe we should treat them the same."

Many newer computers come with a built-in button that summons Microsoft's compact AI assistant, Copilot—a feature that cannot be disabled. Furthermore, search results and AI-generated responses seem to come in a package deal nowadays, with Google's AI overview illuminating across your screen in place of top results. So let's face it: AI is nearly impossible to avoid, even for those that do not intend to use it. This raises an important question: is AI use considered a form of academic dishonesty if it's unintentional or unwilling? To what extent should AI use be allowed before it crosses the line into cheating?

"Sure, read it. But that's not your source," asserted Masters. "You've got to go digging for your information. So do I think it's unavoidable? I think that's a choice. And if you choose to use it in lieu of your own critical thinking, then yeah, I think that's academic dishonesty."

According to a 2025 study from Pew Research Center, only one percent of people habitually verify linked sources when provided with a Google AI summary. Instead, they trust that the information is accurate—the exact opposite of academic honesty.

"The thing is that students have to be proactive in making sure that what they're taking from that information is accurate and reliable, just like how you would go to any news source and check whether they're saying something biased or not biased," reasoned Jayakumar.

This easy access to often unreliable information can be correlated with a higher rate of use, especially amongst students. It does, after all, seem like a bottomless well of information. Accurate or not, it's undeniably a temptation that countless students succumb to.

"You know at some point, students need to learn self-control, right? There's probably stuff in your house that is one step away from your use that you ought not be using," Masters said.

It's easy to fall prey to the allure of AI searches in a world where, according to both Google's AI overview and a verifiable report from Forbes, the economy itself relies on companies like OpenAI. Teachers like Masters believe it still falls on students to use good practice when verifying their information, especially in the face of such temptations.

"I think that our role as high school teachers is to teach critical thinking… and I have a lot of concerns with students' decreasing abilities to intellectually wrestle with information," Masters said.

AND OVER VIEW

"Did You Use AI?"

Artificial Intelligence Affecting Student-Teacher Relationships

By Christina Saad || STAFF WRITER

A familiar scene for many teachers starts with pulling a student out of class and asking them the not-so-age-old question: "Did you write this?" A hesitant yes, a blatant no, perhaps some fidgeting. Maybe they did, maybe they didn't. Regardless—an uncomfortable scene for both parties.

What should be a simple, structured process often becomes a detective investigation for many Andover High School teachers. When grading assignments, social studies teacher Kathryn Vives feels she must spend additional time assessing whether a student is using artificial intelligence (AI) or not.

On the flip side, a student is adding the finishing touches to their essay, blinking sleep out of their eyes as they stare at the bright box in front of them. Before submitting their assignment, they run their essay through every possible AI detector—ZeroGPT, Quillbot, Scribbr. Uh oh, they used em-dashes.

For students, it can become a battle of defense between AI detectors and themselves when it comes to submitting a writing assignment. Sophomores Rachel Ong and Ania Manvar expressed the need to change their writing style so it wouldn't be wrongfully "detected as AI."

"I shouldn't have to dumb down my writing," said Manvar. "The whole point is for me to do the best I can."

When a teacher has to confront a student about AI, it can lead to friction. Teachers may be upset that their lessons are seemingly disregarded, while students may feel defenseless against accusations. AI usage, a prevalent issue at AHS, may be directly impacting the relationship between students and teachers, making it similar to that of a plaintiff and a defendant.

"A teacher hates telling a student that they cheated," Vives said. "I hate to even say the word, but that's what it is." Vives first reads through a student's work, and, if the use of AI is suspected, runs it through an AI detector and checks the draftback, a Chrome extension for Google Docs that creates a time-lapsed video playback of the document's revision history, showing edits and allowing teachers to analyze a student's writing process.

Computer science teacher Marianne Bezaire said that for students, it can be difficult if they completed their own work but it somehow appeared as AI. Furthermore, it may hurt the student if they feel like they're not trusted by their teachers.

"There are always kids that do use AI, but there're a lot of kids who do their work, and it can be really frustrating when you put in a lot of effort and you're accused of plagiarizing your work," said sophomore Ishwa Dharan.

Vives stated the results of an AI detector are never definitive proof of AI usage. "There is no absolute certainty, and so if we go by that guideline, well, then nobody in this school is using AI," she said. "And we know that that is not the case either, so we have to rely on our professional experience and the tools we do have."

Social studies teacher Matthew Bach, who is against any use of AI during the writing process, explained that AI is being thrust upon schools by businesses in order to create a marketplace. That being said, both students and teachers use AI as a tool. Bezaire said teachers are encouraged to use AI to develop their lessons. Furthermore, Vives has used it to make adjustments to rubrics. Several students that were interviewed also used AI to study for tests.

Bezaire supported the idea that AI could be used for learning. "It's like your own built-in tutor," said Bezaire. "It's really on them to take the responsibility about how they prompt AI."

Ong and Manvar said they've even been encouraged by their teachers to use AI as a resource. According to Manvar, students were told to use ChatGPT to find sources.

Some students and teachers agreed that AI should be used more in the future. Sophomore Ashley Bungcayao explained that it may be necessary to use AI as it's applied to the workforce.

So how should we use it, and how should we restrict it? An outright ban might not be feasible, but, evidently, some restriction is a must.

"[It] is highly likely many students are using it at this point," said Vives. "And I think that that's not an exaggeration."

Currently, the school policy prohibits inappropriate use of AI. When AI usage is suspected, the general procedure is to contact the student's assistant principal. Communication between the student, teacher, and their assistant principal will follow.

"It's an opportunity for the student to explain what's going on, and we really want students to be honest," said AHS Principal Jimmy D'Andrea.

Bach stated that setting a clear policy around AI early on will reduce the number of students attempting to use AI on assignments. He finds that students are less likely to use AI when they are aware of the consequences.

Additionally, Vives expressed the need to change her assessment approach to combat the use of AI in recent years. She feels that increasing the number of in-class assessments is necessary to prevent students from using AI.

Assistant Principal Jeremy Hall expressed that students may feel encouraged to cheat because of academic pressure.

Senior Nicole Cirino expressed a similar sentiment. "I think at least 95% of the school uses AI," she said. "There's a lot of pressure for people to do well, and that's why a lot of people take a bunch of AP classes or honors or enriched."

AI is a complex issue, and there is no clear cut solution to reduce AI usage at the school. Some feel AI should be used, while others may disapprove of it entirely. AI is causing friction between students and teachers in regard to academic dishonesty.

"I don't think it's some sort of dramatically new thing that students might cut corners. I think that's always been an issue in any educational institution," said Bach. "But it is something that we have to respond to very clearly, because nothing strikes at the heart of why we're here more than academic dishonesty. That's one thing that cannot be tolerated."

PHOTO ILLUSTRATION **/ Saarvi Deshwal**

Teacher Marianne Bezaire and senior Isabella Yan recreate what it might look like when a teacher confronts a student for suspected AI usage in class.

Hey!

What About the Teachers?

Teachers' Use of AI For Educational Materials

By Kendall Murphy, Duru Tanriverdi & Samantha Sun
STAFF WRITERS

For as long as students have been using artificial intelligence (AI), teachers have been too, causing discussions about the benefits and consequences of educators using AI in the classroom.

When it comes to assignments such as essays, narrative writing, and opinion pieces, there is debate on whether AI has the capabilities to assess a student's work. If it is immoral for a student to create work using AI, is it immoral for a teacher to have the same system decide the grade of a student's work?

"AI is fine if you use it responsibly, but it might get things wrong, creating more problems rather than fixing them," freshman Taylor Nelson said. "I understand AI can be easier, but it's not always efficient."

Just as students are advised not to trust AI as a source of information, as it can have "hallucinations," AI's ability to grade work can also be faulty. It can be prone to error, lack human authenticity, and cause mistrust between teachers and students.

"The nuance and the connection between the work, my students, and myself would be missing [if I used AI]," said special education and humanities teacher Christopher Maniachi.

While there are consequences, there are also benefits for teachers using AI for educational purposes.

AI can be beneficial in terms of creating a lesson plan or formatting a worksheet, a job that is objective and doesn't use human opinion—like grading, but does tend to be tedious. "I usually use AI for work that doesn't need a lot of creativity and intellectual input," French teacher Olga Kostousova said. "It's like my secretary more than my boss."

Teachers also tend to lean on AI when they need to save time. Kostousova explained how language courses aren't provided with curricula to follow, making it more difficult to create assignments for students. She can't simply pull out lessons, quizzes, or tests from a textbook like other teachers. "It's extremely time consuming," said Kostousova, explaining how she has to come up with new lesson plans every day.

AI's assistance gives teachers extra time on other tasks they need to focus on instead of spending hours creating lesson plans. "It is a tool that saves me time when I'm trying to individualize my lessons. It can also provide ideas or angles that I would not have thought of," explained Maniachi.

All students have different learning levels and, unfortunately, most lessons are made for only one type of learner. With AI, a teacher can compact a text into something easier to understand while still explaining the basis of the topic. Maniachi pointed out that it can be beneficial for tailoring a student's work to how they best learn.

Whether it is the teacher or the student, AI is an invention we are still coming to terms with. It is important we learn to utilize it in the classroom responsibly. "We need workshops. We need tools. Because the prompt 'write an essay for me' [is] not beneficial for anyone," said Kostousova, advising for more guardrails and transparency for AI, before either students or teachers use it in an academic setting.

"Both students and teachers need to see AI for what it is: a tool that can help, but not replace critical thinking and learning," added Maniachi.
